

Hands-Free Touch Screen

As touchscreen technology becomes a critical component in the military and other evolving industries, workflow interruptions due to touchscreens continually result in mistakes and/or delays. Because touchscreen technology requires the user to rely on their hands and fingers to operate, limitations such as protective gloves, potential contamination, or handheld weapons can lead to wasteful steps including removing gloves or setting down other equipment before operating the screen. Inventina has designed Sans Hands, a device worn on the wrist or extremity to allow the use of the hands or fingers in tandem with using a touchscreen. Sans hands will allow military personnel across several divisions to maintain efficient workflow while utilizing tablets or touch screen technology. This device can assist not only combat soldiers, but also mechanics, medics, and dining staff when working with digital materials.

This device is patent pending.
